Developmental dysplasia of the hip

Maternity Department
Patient Information Leaflet
Introduction
Your baby's hips were checked at birth as part of the newborn physical examination. Having had this examination, the midwife/doctor suspects that your baby may have developmental dysplasia of the hip. This leaflet gives more information about what this is and how it is diagnosed.

What is development dysplasia of the hip?
Developmental dysplasia of the hip (DDH) is a condition where the ball and socket joint of the hips does not form properly. It is also sometimes known as congenital hip dislocation or hip dysplasia.

The hip joint connects the thigh bone to the pelvis. The top of the thigh bone is rounded like a ball and sits inside the cup-shaped hip socket.

In DDH, the socket of the hip is not well developed and the top of the thigh bone is not held tightly in place. In severe cases, the top of the thigh bone can come out of the socket (dislocate).

Without treatment, DDH may lead to problems later in life, including:

- developing a limp
- hip pain – especially during the teenage years
- painful and stiff joints (osteoarthritis)

With early diagnosis and treatment, most children are able to develop normally and have a full range of movement in their hip.

How is DDH diagnosed?
In order to diagnose DDH, your baby will need to have an ultrasound scan. You will receive an appointment for the T & O (trauma and orthopaedic) Paediatric Clinic within two weeks of your baby's birth. It is essential for your baby to attend this appointment.

On the day of the appointment, your baby will have an ultrasound scan of the affected hip(s) and an assessment by a member of the medical team.
We will discuss the results of the scan with you and if DDH is diagnosed, the appropriate treatment will be discussed with you. If you are unable to attend the appointment, please contact Outpatient Booking Team on 01384 365100.
