

Management of Diabetes Undergoing Elective Surgery

Diabetes and Endocrinology

Patient information leaflet for
patients on basal (background)
insulin

These instructions are for patients with diabetes who are on background insulin. For example, Lantus, Levemir, Toujeo, Tresiba, Insulatard, Humulin I.

If you take other insulins as well, the following would **not** be appropriate instruction. Please ask staff to give you the correct leaflet for your needs.

On the day before surgery

Continue your usual diabetic medications and follow any bowel preparations as advised by your surgeon/staff at the pre-assessment clinic.

On the day of surgery

Continue taking your background insulin, at the same dose.

If you are taking metformin (Glucophage) continue to take this. All other diabetic medications should be stopped from time of fasting.

Remember to bring to hospital all your diabetes medications, dextrose tablets and blood testing equipment

When you arrive at hospital your blood glucose will be tested by finger prick and then monitored regularly. You can ask for extra blood testing if you feel symptoms of a 'hypo' (low blood glucose).

The target for safe surgery is 6 – 10 mmol. You may need insulin treatment to bring down high glucose, or dextrose infusion for treatment of low blood glucose.

After surgery

You will be discharged when you are eating and drinking normally and your blood glucose is at a safe level.

However, if you are unwell with:

- **Continuous** vomiting/diarrhoea, or high fever
- **Unable** to keep food down for 4 hours or more
- **High** blood glucose (>15.0 mmol by finger prick testing)
- **High** ketones (>0.6 mmol)

You should seek medical help. During office hours contact your usual Diabetes Specialist Nurse or Doctor.

At other times contact your local out-of-hours GP service.

Please use this space for any notes you may wish to make

If you have any questions, or if there is anything you do not understand about this leaflet, please contact:
